

ALM Octane

Git Integration Tool

User Guide

Introduction

This tool can be used in order to fetch pull requests from git repositories into Octane.

Note: Only Bitbucket is supported at the moment.

Limitations

- This solution can be used for one instance of Octane with multiple shared spaces and workspaces. In case you desire to use this utility on more than one Octane instance, you will need to reinstall the utility for each instance.
- In the current version we support only one Bitbucket instance connected to an Octane instance. Multiple repositories and projects from that instance of Bitbucket can be connected to Octane.
- In order to fetch the pull requests correctly, the commits data must be present in Octane, not only in the repository.
- If the configuration file (**\conf\configuration.properties**) is modified, the server must be restarted.

Prerequisites

One instance of each application below is required for the integration:

- Octane – Version 12.60.47 and higher
- Bitbucket – Version 5.16 and higher
- Tomcat – Version 7.0 and higher
- Jetty – Version 9.4.20 and higher

Deployment

In order to install the tool, you will need the **git-integration-for-octane.war** file and a java web application server such as Tomcat, where the artifact can be deployed to.

Please follow the steps below after adding the war to your web server (Tomcat):

1. Fill in the configuration file, **configuration.properties**, which can be found in the **\conf** folder.

Key	Value
Octane Fields	
octane.server	<p>The URL to the Octane server.</p> <p>Example: <code>http://octane.company.com:8080</code></p>
octane.sharedSpace	<p>The shared spaces of Octane where the utility will be used. The shared spaces must be separated by a comma.</p> <p>Example: <code>1001,1002</code></p>
octane.user	<p>A username (or API key) which has Space Admin and Workspace Admin permissions. If the utility is used for more than one shared space, you should add a username (or API key) for each shared space separated by a comma. Please pay attention because the order matters.</p> <p>Example: <code>user1,user2</code></p>

octane.password	<p>The password (or Secret) for the user. If there are multiple users listed, all the passwords must be provided in the same order.</p> <p>Example: password1,password2</p>
octane.udfName	<p>In order to display the pull requests, the utility will create a memo field. The name of the field must have “_udf” at the end.</p> <p>Example: pull_requests_udf</p>
octane.udfLabel	<p>The name of the field. This is what users will see in the entities Edit form.</p> <p>Example: Pull Requests</p>
Bitbucket fields	
repo.host	<p>The only supported value for this field at the moment is bitbucketserver.</p>
bitbucketserver.url	<p>The Bitbucket URL.</p> <p>Example: http://bitbucket.com:7990</p>
bitbucketserver.access	<p>A Bitbucket Personal access token. Here you can find out how to create an access token for Bitbucket.</p>
Proxy fields (Optional)	
proxy.host	<p>The proxy host.</p> <p>Example: webcache.example.com</p>
proxy.port	<p>The proxy port.</p> <p>Example: 8080</p>

Note: Please pay attention to enter the shared spaces and credentials in the correct order!

Example: user1 with password1 is Space Admin in the Shared Space 1001 and user2 with password2 is Space Admin in the Shared Space 1002. The correct values can be:

```
octane.sharedSpace=1001,1002
octane.user=user1,user2
octane.password=password1,password2
```

OR

```
octane.sharedSpace=1002,1001
octane.user=user2,user1
octane.password=password2,password1
```

2. Add the Get Pull Requests button to Octane.
 - a. Login to Octane with a Site Admin user.
 - b. Click on the **Settings** icon.
 - c. Go to **External action editor**. You can find help about this feature [here](#). All the used attributes are explained in the Help Center.

This example JSON can be used to create the button. The only thing which must be replaced is the highlighted first part of the Tomcat URL (for example **http://localhost:9090/git-integration-for-octane**).

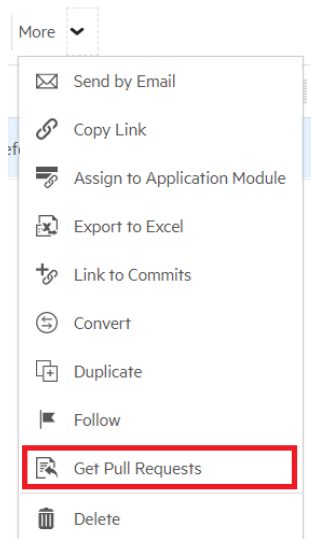

Example:

```
[ {
  "name": "pull_requests_button",
  "title": "Get Pull Requests",
  "entity_type": ["work_item"],
  "views": ["list", "details"],
  "icon": "import",
  "url": "http://localhost:9090/git-integration-for-octane/pull-requests?ids={entity_ids}&entityType={entity_type}&sharedSpace={shared_space}&workSpace={workspace}&dialogId={dialog_id}&server={octane_url}"
  "single_entity": false,
  "events": true,
  "dialog": "small"
}]
```

Some of these attributes, i.e. name or title, can be modified. Please follow the instructions from the [Help Center](#) before modifying any of the attributes' values.

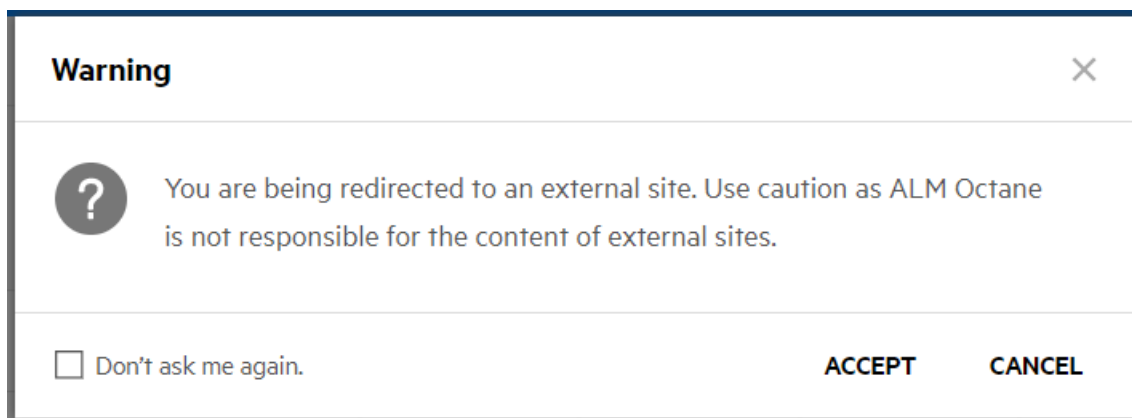

- d. After adding this JSON (with the updated URL) in the External action editor, you need to press **UPDATE** so that Octane will add the button to the entities actions menu.
- e. Refresh Octane.

Now the button should be available in the entities action menu if you select at least one entity, on the detailed view, Backlog or Team Backlog views, as below:

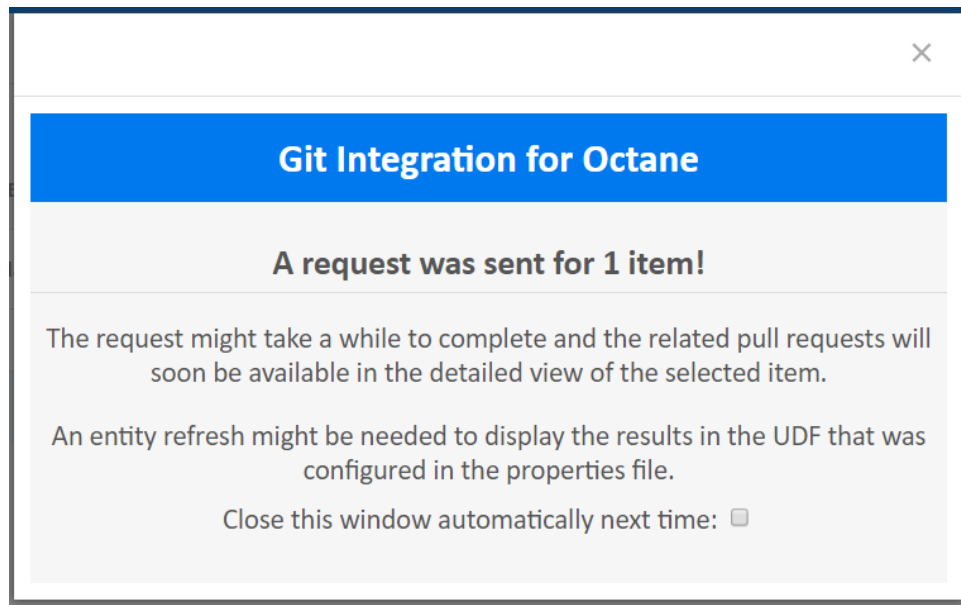

First time usage

Once you have your commits data from Bitbucket brought into Octane, you can start using the tool. You can select all the entities and press the “**Get Pull Requests**” button. For the first time, Octane will display this message:

This is because the Get Pull Requests button, which was just added to Octane, fires a request to the middleware. If you don't want to see this pop up every time you click the button, you can check the **“Don't ask me again”** checkbox.

For every call (button press), the middleware will display the following content:

If the checkbox is selected, this window will automatically close after 4 seconds and the detailed view of the entities will be refreshed.

Note: The content of the window will not change in case there are any errors or delays. The calls to fetch the pull requests are done while this message is displayed. In case of any latencies please check the logs (\git-integration-for-octane\logs) for errors or warnings.

The middleware will perform the following actions when the button is pressed for the first time:

1. For epics, features, defects, user stories and quality stories, the memo UDF (where the pull requests will be listed) will be created.
2. The UDF will be added into the Edit form for every entity listed above. This means that users will see the UDF when they edit an entity.
3. A new rule will be added, in order to make the UDF read only. This rule will be created for all the entities mentioned above.

The rule makes the UDF read-only for all the users, except the ones with Space Admin permissions.

For Isolated Spaces, the items mentioned above will be created at workspace level. For Shared Spaces, the items will be created in the master workspace and inherited in the rest of the workspaces.

After all the operations are completed the pull requests links and states will be entered into the memo UDF. The pull requests are ordered as they are in Bitbucket, last updated first.

The screenshot displays the Git Integration Tool interface. On the left, the 'DETAILS' tab is active, showing a pull request summary for 'Seventh' (DECLINED). The summary includes the creation time (09/24/2019 16:43:27), item origin, application modules, milestone, and blocked reason. Below the summary, the 'Pull Requests' section lists the status of several pull requests: Seventh (DECLINED), Eleventh (OPEN), Tenth (DECLINED), and Sixth (OPEN). On the right, the 'Pull requests' section shows a list of pull requests for 'FiveDotSixteen / Repo1'. The list is ordered by last updated time, with 'Seventh' at the top. Red arrows point from the 'Seventh' pull request in the list to the 'Seventh' pull request in the details view, and from the 'Eleventh', 'Tenth', and 'Sixth' pull requests in the details view to their respective entries in the list.

Pull Request	Status	Author	Last Updated
Seventh	DECLINED	admin - #7	a moment ago
Eight	MERGED	admin - #8	36 minutes ago
Forth		admin - #4	36 minutes ago
Third	DECLINED	admin - #3	38 minutes ago
Fourteenth		admin - #15	38 minutes ago
Thirteenth	DECLINED	admin - #14	39 minutes ago
Twelfth	DECLINED	admin - #13	40 minutes ago
Eleventh		admin - #12	41 minutes ago
Tenth	DECLINED	admin - #10	44 minutes ago
Ninth		admin - #9	44 minutes ago
Sixth		admin - #6	45 minutes ago
Fifth	DECLINED	admin - #5	46 minutes ago
Second		admin - #11	46 minutes ago
First	MERGED	admin - #2	49 minutes ago

Troubleshooting

By default, the middleware does not display any errors.

In the **git-integration-for-octane\logs** folder, all the logs of the application are available. In case of any errors or latencies please check the logs for ERROR and WARNING messages.

Feedback

This is our GitHub page. Please feel free to share your feedback and suggestions with us there.
